Manayama N., Ueda M., Atomi H., Tanaka A.;
"Genetic evaluation of physiological functions of thiolase isozymes in the n-alkane-assimilating yeast, Candida tropicalis.";
J. Bacteriol. 180:690-698 (1998).
-I- CATALYTIC ACTIVITY: Orotidine 5'-phosphate = UMP + CO(2).
-I- PATHWAY: Pyrimidine biosynthesis.
-I- SIMILARITY: Belongs to the OMP decarboxylase family.

Biochemistry 33:5098-5108(1994).

-!- FUNCTION: Omega-agatoxins are antagonists of voltage-sensitive calcium channels. This toxin is a potent blocker of N-type calcium channels. It also blocks L-type calcium channels, but with less potency than omega-Aga-IIIA. It does not block T-type channels. It blocks calcium currents in locust thoracic neurones, but does not block housefly neuromuscular transmission presynaptically.
                                                                                                                                                                                                                                                                                                                                                                                                              Parol. Biol. 267:2610-2615(1992).

-1- FUNCTION: Omega-agatoxin are antagonist of voltage-sensitive calcium channels. They block insect neuromuscular transmission presynaptically. Potent blocker of N- and L-type calcium channels.
-1- SUBCELLUIAR LOCATION: Secreted.
-1- TISSUE SPECIFICITY: Expressed by the venom gland.
-1- FTM: Contains six disulfide bonds (Probable).
-1- SIMILARITY: Belongs to the omega-agatoxin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PIR, A42335, A42335.
Caclcium Cahanel inhibitor; Direct protein sequencing;
Ionic channel inhibitor: Neurotoxin; Presynaptic neurotoxin; Toxin.

-! FUNCTION: Important for transcription initiation. The SPT4/5/6

-! FUNCTION: Important for transcription initiation. It may normally complex is required for transcription initiation. It may normally act to repress transcription at a variety of loci, and also plays a role in chromatin structure or assembly. Metal binding is important for its function (By similarity).

-!- SUBCELLULAR LOCATION: Nuclear (By similarity).
                                                                                                                                                                                                                                                                                                                                          Hikkel I., Gbelska Y., Subik J.;
"Identification and functional analysis of a Kluyveromyces lactis homologue of the SPT4 gene of Saccharomyces cerevisiae.";

Natl. Acad. Sci. U.S.A. 101:9081-9086 (2004).

-1- FUNCTION: This protein binds specifically to 23S rRNA. It makes multiple contacts with different domains of the 23S rRNA in the assembled 50S subunit and ribosome (By similarity).

-1- FUNCTION: The globular domain of the protein is located near the polypeptide exit tunnel on the outside of the subunit, while an extended beta-hairpin is found that lines the wall of the exit tunnel in the center of the 70S ribosome (By similarity).

-1- SUBUNIT: Part of the 50S ribosomal subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
